

Automatically tracks every carrier's location within your hospital's pneumatic tube system

Automatically link a carrier to a delivery

Pevco Auto-ID™ automatically ties a carrier's ID number to the delivery, creating a real-time, auditable record of the carrier's route.

Know when carriers are manually moved from station to station

Carriers suspected to have been manually transported by staff from one station to another are flagged accordingly, giving insight into carrier count variances.

Enhance accuracy of station carrier counts

Accuracy of station carrier counts (number of carriers in a station's bin) is enhanced by comparing Pevco Auto-ID™ data with carrier inventory levels set within Pevco Atlas™.

Improve carrier maintenance programs

Carrier management and maintenance is streamlined by documenting each time a carrier is used in a transaction.
